TITLE: Study of the conditions of sorption of gallium, aluminum, iron, titanium, and vanadium by means of ion exchange chromatography

SOURCE: Azerbaydzhanskiy khimicheskiy zhurnal, no. 6, 1965, 128-133

TOPIC TAGS: iron, aluminum, vanadium, gallium, titanium, ion exchange chromatography, lithium chloride

ABSTRACT: Sorption of gallium, iron, aluminum, titanium, and vanadium on an EDE-10p anion exchange resin with the use of reagents (hydrobromic and sulfuric acids, lithium chloride, potassium iodide, etc.) capable of forming negatively charged complex ions $[MCl_n]^{v-n}$ (where v is the charge on the metal ion) was studied. A hydrochloric acid solution of LiCl, taken in concentrations of 0.5 to 10 M, was found to promote a complete sorption of the metals from a solution containing 0.05 mg Ga, 3.5

Card 1/2

L 22695-66

ACC NR: AP6006936

mg Fe, 1.9 Mg V, 3.25 mg Ti, and 9.4 mg Al. At an LiCl concentration of 1 M, the gallium absorbability attains 100%, and that of iron, 92.86%; Ga and Fe can thus be separated from V, Ti, and Al. Fe, V, and Ti are sorbed completely when the concentration of LiCl is 8 M. In a 4.5 M solution of hydriodic acid, Ti is completely sorbed by the EDE-10p resin; Ga, Fe, V, and Al pass into the eluate, and are thus completely separated from Ti. Sulfuric and hydrobromic acid do not provide a complete separation of these elements on the EDE-10p resin because of the distribution of the ions between the solid and liquid phases. TITLE: Efficient Use of Drills (K voprosu ratsional'nogo
ispol'zovaniya dolota na zaboye--in Azerbaidzhan)

PERIODICAL: Izv. AN AzSSR, 1956, Nr 7, pp 33-47

ABSTRACT: The author gives a critical review of the literature devoted to the question of efficient use of drills. He concludes that it is impossible to judge the efficiency of drills on the basis of the maximum rate of revolution. Instead, efficiency must be related to the rate of drilling.

TITLE: The inversion of ammonia molecules in solution

SOURCE: Optika i spektroskopiya, v. 19, no. 2, 1965, 229-234

TOPIC TAGS: ammonia, line splitting, molecular spectrum, solution property

ABSTRACT: In view of the contradictory data on the inversion of ammonia in the condensed phase, the authors have calculated the perturbing effect of an Onsager field on this inversion. The parameters of the inversion potential function of NH₃ are determined by using the Bell-Onsager model, according to which the molecule-solvent system is represented as a spherical surface in a continuous dielectric. The height of the potential barrier and the magnitude of the inversion splitting of the fully symmetrical deformation vibration of ammonia are then calculated for some liquid and solid solutions, and the results are compared with the existing experimental data. The results show that the inversion splitting decreases rapidly with increase of the dielectric constant of the solvent, becoming practically unobservable when the dielectric constant exceeds 2. It is pointed out in the conclusion that the results are based on a very simple model and on many simplifying assumptions, and must therefore be regarded as only semiquantitative. "The authors thank

"Distribution of Stresses in a Vibrating Freely Supported Rectangular Plate Uniformly Compressed Along its Edges in one Direction"
Tr. Sredneaz. Un-ta, No 54, 1954, 99-106

The author solves the problem indicated in the title by using Karman's equation for thin elastic plates undergoing finite flexures. He takes into account only transverse inertia. He obtains the solution of the equation by the method of a small parameter. (RZhMekh, No 9, 1955)

Baydosarov, A. D.

2085. Baydosarov, A. D., Distribution of stresses in a round plate with free edges, performing axial-symmetrical oscillations, (in Russian), *Trudi Sredneaz. un-ta* no. 37, 173-181; 1954; *Ref. Zh. Mekh.* no. 12, 1956, Rev. 8541.

A search is made for the stresses in the central area of the plate, when under the influence of natural bending of an axially symmetrical round plate with free edges. The forces of inertia in the area of the plate are considered to be insignificantly small.

TITLE: Elastic-plastic vibrations of thin plates (first article)

SOURCE: Tashkent. Universitet. Nauchnyye trudy, no. 265. Matematicheskiye nauki, no. 29, 1964. Trudy Vychislitel'nogo tsentra, no. 1, 9-18

TOPIC TAGS: thin plate, elastic deformation, plastic deformation, vibration analysis

ABSTRACT: The purpose of this article, the first of a series, is to derive differential equations for the vibrations that correspond to large and small flexures in a thin plate during the stage of elastic-plastic deformation under simple loading. The equations are based on the differential equations of motion of an element in the central plane of the plate, and are expressed in terms of the components of displacement of the points of the plane and of a function characterizing the elastic and plastic properties of the material. Allowance is then made for the deformations of the central plane. The static equations for different cases and the equations for different types of support of the plate, are derived from the general equations. Orig. art. has: 43 formulas.

Abstract: month. The measurements of the head are subject to the least relative changes. Yearling ewes develop lengthwise and broadwise better than yearling rams. Since milking of ewes has unfavorable influence upon the growth of lambs, it is recommended to milk the ewes after the lambs are three months old.

Orig Pub : Tr. Yerevansk. zootekhn.-vet. in-ta, 1957, vyp. 21, 117-124

Abstract : The average live weight of the white-breed sows until the age of 2 amounts to 145.7 kg, and that of sows of 2 and more years, to 181.6 kg. The fertility is 11.25 and 8.88 piglets, respectively. The milk yield of sows in both age groups is 48 kg. It is recommended that young swine be mated after reaching a live weight of 130 kg.

AUTHORS: Kovalenko, P. N. and Bagdasarov, K. N.
TITLE: Electrode Polarization in the Electrodeposition of Cadmium,
Tin, and Antimony
PERIODICAL: Ukrainskiy khimicheskiy zhurnal, 1960, Vol. 26, No. 5,
pp. 573-578

TEXT: Polarization in the electrolytic reduction of Cd, Sn, and Sb has been studied under conditions of practical quantitative electroanalysis. Copper- and nickel-plated Pt grid cathodes, and also spiral nichrome or Al electrodes were used for the purpose. The cathode potential was measured by the method of compensation. The effective activation energy B was calculated from the function $\log I = A - B/2.3RT$ (1) (I - current density; A - constant; B - effective activation energy). To be independent of variations in current density, the initial current density I_1 and the final current density I_n were substituted in equation (1). From the equation $\log(I_1/I_n) = (B/2.3R)(1/T_n - 1/T_1)$ B was calculated to be
Card 1/2

deposition of Cadmium, Tin, and Antimony

S/073/60/026/005/004/019
B004/B063

4.57 $\Delta \log I(\Delta/T)$. The effective activation energy obtained for Cd was equal to 10,000 cal/mole. Chemical polarization occurred during the reduction of Cd on the copper-plated Pt electrode. For the reduction of Sn and Sb on the copper- and nickel-plated Pt electrodes, activation energy was 6000-6700 cal/mole. This process was accompanied by concentration polarization. The metals were quantitatively deposited in the form of brilliant, fine-crystalline substances. The high value of B (12,000 - 13,000 cal/mole) during the electrolysis of Sn and Sb on an Al cathode is due to the destruction of the passivating film on the Al surface. The Sn and Sb deposits became loose as a result of the dissolution of Al. Nonetheless, they were quantitatively deposited. S. V. Gorbachev is mentioned. There are 4 figures, 2 tables, and 11 Soviet references.
